

Introduction

The Toro R Series sprinkler conversion assemblies provide a convenient, cost-effective method of upgrading existing Rain Bird® Eagle™ 900 and 1100 Series sprinklers to industry-leading Toro irrigation technology.

Benefits include:

- Simple, flexible TruJectory™ spray height adjustment
- 1½" (38mm) increase in pop-up height
- Adjustable 40°–330° part-circle and true 360° full circle rotation in one sprinkler (855RB/DT55RB series)
- Ratcheting riser and arc adjustment band for easy, accurate watering pattern definition.

Installation Procedure

⚠ WARNING: Prior to performing any service procedure on a large-turf irrigation system, ensure the controller and water supply are shut off and secured to prevent inadvertent operation. When manually operating the sprinkler pilot valve, never stand or lean over the top of the sprinkler. When performing arc/spray adjustment procedures during operation, never come in full contact with spray. Failure to comply can result in serious injury.

1. Insert a small screwdriver blade through the slot provided in the sprinkler assembly retaining ring. Pry the end of the ring out of the body, then work the blade around the retainer to remove.

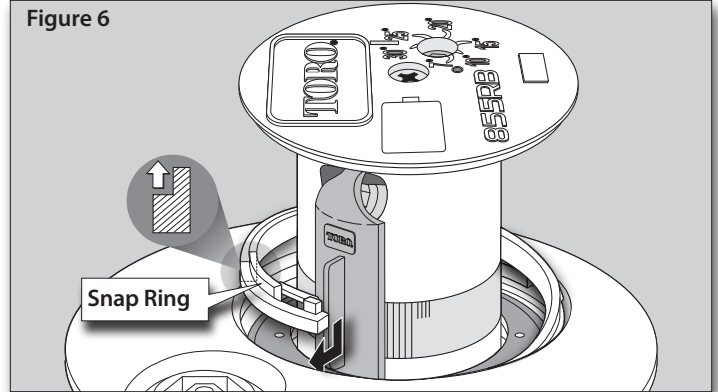

2. Pry the sprinkler assembly up and out of the body.

3. Ensure the conversion assembly is prepared for installation with the riser hold up tool inserted as shown in Figure 3.

4. Insert the conversion assembly into the body ensuring the ratchet ring is properly keyed to the body guides.

5. Press the seal retainer into the body until it bottoms out – just below the bottom of the snap ring groove. See **Figure 5**.
6. Fit the snap ring onto the riser assembly, orienting the stepped side facing up (as shown in the cross section in **Figure 6**).

7. Insert either end of the snap ring into the groove just above the seal retainer. Continue working the ring into the groove until it is fully seated and flush against the seal retainer.
Note: When properly installed, the snap ring end gap will measure approximately 1/2" (13 mm).

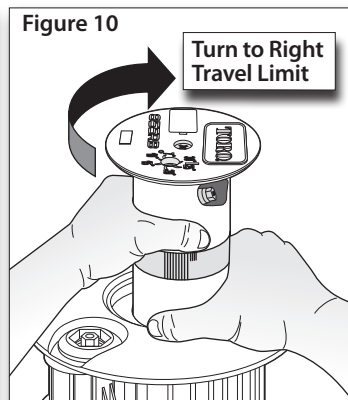

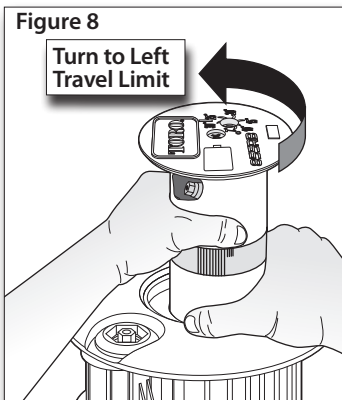

855RB and DT55RB Series Arc Pattern Adjustment

The left side of the sprinkler's part-circle arc pattern is non-adjustable, requiring all arc pattern adjustments to be made on the right side of the pattern. Adaptive arc adjustment enables the pattern to be set in 5° increments, ranging from 40° minimum, to 330° maximum. Standard part-circle arc settings for 1/4, 1/2, 3/4, and continuous full-circle rotation are indicated on the riser assembly, enabling the watering pattern to be easily set prior to installation.

Note: The 855RB and DT55RB sprinkler conversion assembly arc pattern is factory-set to 180° (1/2 circle).

Adaptive Arc Adjustment – 40° to 330°

1. Insert the end of the Multipurpose Tool (#995-83) into the slot provided in the top of the cap. Hook the inner edge of the cap to pull the riser assembly up. Grasp the riser assembly firmly below the arc adjustment band to prevent retraction. See **Figure 7**.
2. Slowly rotate the nozzle turret back and forth to locate the current left and right travel limits. Leave the nozzle turret rotated to the left travel limit. See **Figure 8**.
3. Align the nozzle turret with the left watering border by rotating the ratcheting riser assembly in either direction. See **Figure 9**.
⚠ Caution: Never attempt to turn the ratcheting riser assembly during operation. Forcing the riser assembly to turn can result in severe sprinkler damage.
4. Rotate the nozzle turret clockwise to the right travel limit. See **Figure 10**.
5. Squeeze and hold the arc adjust band at the ribbed section. Rotate the nozzle turret in either direction to the desired right limit, then release pressure on adjustment band. See **Figure 11**.
6. Slowly rotate the nozzle turret back and forth to check the adjusted arc pattern.
7. Check the arc pattern again during sprinkler operation. Fine tune the arc as needed to achieve the optimum watering pattern.

Standard Arc and Full Circle Adjustment

The arc adjustment band is marked for 1/4, 1/2, 3/4 and full-circle settings.

1. Squeeze the ribbed area of the arc adjustment band (see **Figure 11**), then rotate the band to align the desired indicator with the arrow indicator on the side of the nozzle turret (directly below the back nozzle). See **Figure 12**.

Main Nozzle Trajectory Adjustment

Main nozzle spray trajectory can be easily adjusted up or down to help compensate for difficult watering conditions, such as mounded turf or low overhead obstructions.

The default trajectory setting is 25°. The 855RB sprinkler series has an adjustment range of 7° to 30°, and is accessed through the top of the cap, either wet or dry. The DT55/54RB series sprinklers provide a 15° or 25° trajectory angle, and are adjusted dry with the sprinkler cap removed.

Note: Spray radius will decrease proportionally when decreasing the trajectory angle.

For DT55/54RB series: A #2 Phillips screwdriver and a 5/8" nut driver (p/n 995-83) are required for this procedure.

1. Remove the cap screw and cap.
2. Rotate the main nozzle assembly clockwise to orient the indicator tab to the 15° or 25° trajectory position as shown in **Figure 13**.
3. Reinstall the cap.

For 855RB series: A 5/16" nut driver (p/n 995-105) is required for this procedure .

1. Turn the trajectory adjuster left to increase, or right to decrease angle. See **Figure 13**.

Main Nozzle Diffusion Adjustment (optional)

A 3/32" hex driver (P/N 995-82) is required for this procedure.

1. Move the diffusion screw from its storage position next to the cap screw, to the pilot hole in front of the main nozzle.
2. With the sprinkler operating, adjust the screw depth for the preferred amount of spray diffusion.

Caution: The diffusion screw can be lost in the nozzle stream if over-adjusted.

Cap Marker Installation

The lavender-color cap insert (provided), or optional yardage markers are easily installed in place of the blank insert. A small slotted screwdriver and diagonal cutters are required for this procedure.

1. Insert the screwdriver tip under the inside edge of the blank cap and pry upward to remove..
2. Press the inserts into place, flush with the cap.
3. Trim off the two outer insert tabs, flush with the bottom of the cap.

☐ Not recommended at these pressures. Radius shown in feet.
 Toro recommends the use of a 1/4" swing joint at flows over 25-GPM (95-LPM). Sprinkler radius data collected in Toro's zero wind test facility per ASAE standard S398.1. Actual site conditions must be considered when selecting the appropriate nozzle.
